

Data visualization in R

Mikhail Dozmorov

Fall 2016

Why visualize data?

- Four groups
- 11 observations (x, y) per group

Property	Value
Mean of x in each case	9 (exact)
Sample variance of x in each case	11 (exact)
Mean of y in each case	7.50 (to 2 decimal places)
Sample variance of y in each case	4.122 or 4.127 (to 3 decimal places)
Correlation between x and y in each case	0.816 (to 3 decimal places)
Linear regression line in each case	$y = 3.00 + 0.500x$ (to 2 and 3 decimal places, respectively)

https://en.wikipedia.org/wiki/Anscombe%27s_quartet

R base graphics

- `plot()` generic x-y plotting
- `barplot()` bar plots
- `boxplot()` box-and-whisker plot
- `hist()` histograms

http://manuals.bioinformatics.ucr.edu/home/R_BioCondManual#TOC-Some-Great-R-Functions

Don't use barplots

These look the same!

Wait a minute...

Oooh!

Weissgerber T et.al., "Beyond Bar and Line Graphs: Time for a New Data Presentation Paradigm", PLOS Biology, 2015 <http://journals.plos.org/plosbiology/article?id=10.1371/journal.pbio.1002128>
<https://cogtales.wordpress.com/2016/06/06/congratulations-barbarplots/>

R base graphics

- `stats::heatmap()` - basic heatmap

Alternatives:

- `gplots::heatmap.2()` - an extension of heatmap
- `heatmap3::heatmap3()` - another extension of heatmap
- `ComplexHeatmap::Heatmap()` - highly customizable, interactive heatmap

Other options:

- `pheatmap::pheatmap()` - grid-based heatmap
- `NMF::aheatmap()` - another grid-based heatmap

More heatmaps

- `fheatmap::fheatmap()` - heatmap with some ggplot2
- `gapmap::gapmap()` - gapped heatmap (ggplot2/grid)

Interactive heatmaps:

- `d3heatmap::d3heatmap()` - interactive heatmap in d3
- `heatmaply::heatmaply()` - interactive heatmap with better dendrograms

Compare clusters

- `dendextend` package - make better dendrograms, compare them with ease

<https://channel9.msdn.com/Events/userR-international-R-User-conference/useR2016/Heatmaps-in-R-Overview-and-best-practices>

Other useful plots

- `qqnorm()`, `qqline()`, `qqplot()` - distribution comparison plots
- `pairs()` - pair-wise plot of multivariate data

http://manuals.bioinformatics.ucr.edu/home/R_BioCondManual#TOC-Some-Great-R-Functions

Special plots

- `vioplot()`: Violin plot, <https://cran.r-project.org/web/packages/vioplot/>
- `PiratePlot()`: violin plot enhanced. `install_github("ndphillips/yarr")`, <http://nathanieldphillips.com/>
- `beeswarm()`: The Bee Swarm Plot, an Alternative to Stripchart, <https://cran.r-project.org/web/packages/beeswarm/index.html>

Saving plots

- Save to PDF

```
pdf("filename.pdf", width = 7, height = 5)  
plot(1:10, 1:10)  
dev.off()
```

- Other formats: `bmp()`, `jpg()`, `pdf()`, `png()`, or `tiff()`

Data manipulation

dplyr: data manipulation with R

80% of your work will be data preparation

- getting data (from databases, spreadsheets, flat-files)
- performing exploratory/diagnostic data analysis
- reshaping data
- visualizing data

<http://www.gettinggeneticsdone.com/2014/08/do-your-data-janitor-work-like-boss.html>

dplyr: data manipulation with R

80% of your work will be data preparation

- Filtering rows (to create a subset)
- Selecting columns of data (i.e., selecting variables)
- Adding new variables
- Sorting
- Aggregating
- Joining

<http://www.gettinggeneticsdone.com/2014/08/do-your-data-janitor-work-like-boss.html>

Dplyr: A grammar of data manipulation

<https://github.com/hadley/dplyr>

```
install.packages("dplyr")
```

The pipe %>% operator

- Pipe output of one command into an input of another command - chain commands together
- Think about the “|” operator in Linux
- Read as “then”. Take the dataset, *then* do ...

```
library(dplyr)
library(ggplot2)
data(diamonds)
head(diamonds)
diamonds %>% head
summary(diamonds$price)
diamonds$price %>% summary(object = .)
```

dplyr::filter()

- Filter (select) rows based on the condition of a column

```
diamonds %>% head
df.diamonds_ideal <- filter(diamonds, cut == "Ideal")
df.diamonds_ideal <- diamonds %>% filter(cut == "Ideal")
```

dplyr::select()

- Select columns from the dataset by names

```
df.diamonds_ideal %>% head
select(df.diamonds_ideal, carat, cut, color, price, clarity)
df.diamonds_ideal <- df.diamonds_ideal %>% select(., carat, cu
```

dplyr::mutate()

- Add columns to your dataset

```
df.diamonds_ideal %>% head
mutate(df.diamonds_ideal, price_per_carat = price/carat)
df.diamonds_ideal <- df.diamonds_ideal %>% mutate(price_per_carat = price/carat)
```

dplyr::arrange()

- Sort your data by columns

```
df.diamonds_ideal %>% head  
arrange(df.diamonds_ideal, price)  
df.diamonds_ideal %>% arrange(price, price_per_carat)
```

dplyr::summarize()

- Summarize columns by custom summary statistics

```
summarize(df.diamonds_ideal, length = n(), avg_price = mean(price))  
df.diamonds_ideal %>% summarize(length = n(), avg_price = mean(price))
```

dplyr::group_by()

- Summarize *subsets of* columns by custom summary statistics

```
group_by(diamonds, cut) %>% summarize(mean(price))  
group_by(diamonds, cut, color) %>% summarize(mean(price))
```

The power of pipe %>%

- Summarize *subsets of* columns by custom summary statistics

```

arrange(mutate(arrange(filter(tbl_df(diamonds), cut == "Ideal"),
arrange(
  mutate(
    arrange(
      filter(tbl_df(diamonds), cut == "Ideal"),
      price),
    price_per_carat = price/carat),
  price_per_carat)
diamonds %>% filter(cut == "Ideal") %>% arrange(price) %>% mut

```

ggplot2 - the grammar of graphics

ggplot2 package

`http://ggplot2.org/`

```
install.packages("ggplot2")
```

ggplot2

ggplot2 is a plotting system for R, based on the grammar of graphics, which tries to take the good parts of base and lattice graphics and none of the bad parts. It takes care of many of the fiddly details that make plotting a hassle (like drawing legends) as well as providing a powerful model of graphics that makes it easy to produce complex multi-layered graphics.

Documentation

ggplot2 documentation is now available at docs.ggplot2.org.

The basics of ggplot2 graphics

- Data mapped to graphical elements
- Add graphical layers and transformations
- Commands are chained with “+” sign

Object		Description
Data		The raw data that you want to plot
Aesthetics	<code>aes()</code>	How to map your data on x, y axis, color, size, shape (aesthetics)
Geometries	<code>geom_</code>	The geometric shapes that will represent the data

data +
 aesthetic mappings of data to plot coordinates +
 geometry to represent the data

Examples of ggplot2 graphics

```
diamonds %>% filter(cut == "Good", color == "E") %>%  
  ggplot(aes(x = price, y = carat)) +  
  geom_point() # aes(size = price) +
```

Try other geoms

```
geom_smooth() # method = lm  
geom_line()  
geom_boxplot()  
geom_bar(stat="identity")  
geom_histogram()
```

Fine tuning ggplot2 graphics

Parameter	Description
Facets	facet_ Split one plot into multiple plots based on a grouping variable
Scales	scale_ Maps between the data ranges and the dimensions of the plot
Visual Themes	theme The overall visual defaults of a plot: background, grids, axe, default typeface, sizes, colors, etc.
Statistical transformations	stat_ Statistical summaries of the data that can be plotted, such as quantiles, fitted curves (loess, linear models, etc.), sums etc.
Coordinate systems	coord_ Expressing coordinates in a system other than Cartesian

Putting it all together

```

diamonds %>%
  filter(cut == "Ideal") %>% # Start with the 'diamonds' data
  ggplot(aes(price)) +      # Then, filter rows where cut ==
  geom_histogram() +      # Then, plot using ggplot
  facet_wrap(~ color) +   # and plot histograms
  ggtitle("Diamond price distribution per color") + # in a 'small multiple' plot, bro
  labs(x="Price", y="Count") +
  theme(panel.background = element_rect(fill="lightblue")) +
  theme(plot.title = element_text(family="Trebuchet MS", size=
  theme(axis.title.y = element_text(angle=0)) +
  theme(panel.grid.minor = element_blank())

```
